Changes version 24.3.0

## Table of contents

Improvements

Number search

In a number search with Kind-Of-Document "JP S60178709 A1", the document code "A1" was removed as soon as the search returned no hits. The search was limited to "JP S60178709" and the search was carried out again without specifying the child of document. In this case, all documents with country code/publication number were displayed. Therefore, a utility model " JP S60178709 U" could also appear as a hit.

Before the improvement:

➔ The adjustment means that the search function does not display any documents of type U/Y if a document type is specified that does not match U/Y.
➔ Utility models are found as soon as they are specifically searched for or a search is created without a Kind-Of-Document.

After the improvement:

Monitoring task

Our software has a filter for "granted" patents in the monitoring tasks.
This can lead to time discrepancies: With the notification we receive from the patent office that a patent has been granted, our software shows the patent as granted. Although we can mark the patent as granted, we may not yet be able to provide the associated document if it is not yet available to us.

➔ As a result, an additional filter has been implemented. This checks whether a granted document already exists in our database.
